# CAUTION!! Do not attempt any maintenance on this equipment unless the unit is disconnected from the power source. 

## Read Immediately:

All packages must be closely inspected for damage upon receipt. Compare the quantity listed on the packing slip with the bill of lading. Any damage or shortage to the shipment must be noted on the bill of lading at the time of delivery.

Once a bill of lading is signed for, the likelihood of collecting any amount on a concealed freight claim is significantly reduced.

All damages, noted or concealed, must be reported to the carrier within 15 days of the delivery date. Transportation companies will not honor a claim if the request for inspection is not made within this 15-day period. MAXANT cannot be held responsible for damage noted after delivery.

## Thank you!

Dear Valued MAXANT Customer:
Thank you for your purchase of MAXANT illuminators. MAXANT takes pride in ensuring that you and your facility enjoy many years of quality illuminator performance. We very much appreciate your business and look forward to the opportunity to serve you again.

If you have any questions or comments, please contact your local MAXANT dealer or call us directly at 800-307-4190.

### 1.0 Introduction

This manual covers dimensional information, operational instructions and technical specifications for the TECHLINE 200, 300 and 400 series illuminators. These devices are intended to aid in the reading of medical x-ray films using back lighting. All TECHLINE illuminators utilize a universal body design that offers two-, three- or four-lamps per panel. All TECHLINE illuminators are shipped with lamps ready to install and operate. The exception is DVC series, which requires some field assembly. Remove the shipping tape from the lamp sockets before operating. Configurations are offered from a single viewing panel to six-over-six panels, surface or recess mounted.

### 2.0 Standard and Optional TECHLINE Features

Standard features include:

- Cluster Switching
- Roller Gravity Film Grip
- Minimal 1.8" separation between upper and lower tier
- Easy maintenance and easy lamp replacement

The following chart describes the features of the standard TECHLINE series:

|  | Certification | Film <br> Switch | Dual <br> Intensity | Number of <br> lamps |
| :--- | :---: | :---: | :---: | :---: |
| 200 Series | UL187/CSA114 | Optional | N/a | 2 |
| 300 Series | UL187/CSA114 | Optional | Optional | 3 |
| 400 Series | UL187/CSA114 | Optional | Optional | 4 |

Additional optional features (all are standard on UL60601-1 certified fixtures) for the TECHLINE as a Class One continuous operation medical device:

- Certification to UL60601-1 (EN60601-1) and CE
- Double Pole Master Switch
- Hospital grade plug
- Dual fusing
- Additional filtering for conducted emissions on multi-panel units
- Meets NFPA 99

### 3.0 Product Specifications - Electrical and Illumination

This measured data is considered typical and nominal. Data may vary from unit to unit.

### 3.1 Ballast

Electronic, Class P, Type 1, Low Leakage.

### 3.2 Lamps

Type F15T8/D daylight type fluorescent lamp

### 3.3 Line Cord

Grounded chassis with 8-foot, 3-wire line cord NEMA 5-15P, 2-pole, 3-wire ground Hospital grade cord and plug for UL60601-1 units

### 3.4 Radiated or Conducted Emissions

This equipment has been tested and found to comply with the limits of a Class B digital device, pursuant to Part 15 of the FCC rule. It has also been tested and found to comply with CISPR 15 for Class One medical devices. These limits are designed to provide reasonable protection against harmful interference to other electronic equipment and radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to other electrical equipment or radio/television reception, try one of the following corrective measures:

- Relocate the electronic equipment or its receiving antenna.
- Increase the distance between the illuminator(s) and the electronic equipment that is exhibiting interference.
- Connect the illuminator(s) to an outlet on a different circuit than the interfered electronic equipment.
- Consult the dealer or an experienced radio technician for help.

### 3.5 Fuses (UL or EN 60601-1 only)

Use only fuse IEC Fast-acting type $5 \times 20 \mathrm{~mm}$ ceramic. See tables for correct fuse size. FUSE MUST BE UL, SEMCO, BSI, VDE, CSA, AND MITI LISTED. Please place the order with your Maxant distributor. The "Littlefuse Co." type 216 series is a qualified fuse.

### 3.6 Light Output

These light levels are taken from procedures specified by the German DIN6865 standard. Currently this is the only published standard for evaluating the luminance levels of x-ray illuminators. These levels were measured under the following conditions: an ambient temperature of $21^{\circ}$ Celsius ( $70^{\circ}$ Fahrenheit), 118 Volt line voltage, and new lamps that were allowed to be on for 2 hours before the measurements were made. Light levels measured in the field may vary with the local environment, including: lamp age, line voltage, ambient temperature, and lamp temperature. The measurements published here are subject to change without notice.

### 4.0 Product Specifications - Mechanical

### 4.1 Body Construction

- 18-gauge welded steel construction
- Multi-panel configurations manufactured as an integral assembly
- 3" deep body

### 4.2 Diffusing Panel

- Easily removed to replace lamps - no tools required
- Shatter resistant, UL recognized MC thermoplastic

### 4.3 Film Grip

- Self-adjusting roller-gravity film grip accommodates every film thickness.
- Will not scratch or tear film
- Open sides facilitate viewing of oversized films
- Bottom film ledge accommodates small film formats

**Overall recessed fixture dimensions, including recessed trim length and height, are each 3 " greater than the surface mount dimensions.

### 6.0 Installation and Mounting Instructions

### 6.1 Surface Mounting Installation Diagram ( Example 6 over 6) Cut sheets for all models are available on our web site www.maxant.com or Contact us directly.

### 6.2 Suggested Wall Structure Build Diagram for UL60601 Installation.

The wall shown is a standard wood frame wall made from $2 \times 4$ 's covered with $1 / 2^{\prime \prime}$ plaster wallboard. The cross pieces needed for mounting the illuminators are one $2 \times 4$ and two $2 \times 6$ 's. The vertical studs are notched to accept the cross pieces as shown in the diagram. Use \#10 x $21 / 2^{\prime \prime}$ deckboard countersunk head stainless steel screws to secure the cross pieces to the $2 \times 4$ wall. Use two screws per stud for the $2 \times 6$ 's and one screw per stud on the $2 \times 4$.

Attach illuminators to the wall using \#8 x $11 / 2^{\prime \prime}$ round or Phillips head wood screws and $3 / 4$ " OD \#8 fender washers. For single-tier units, use four screws per unit. For double-tier units, use two screws per unit on the upper tier and four screws per unit on the lower tier. As an alternate, use \#8 high performance serrated thread screws for power drivers (a.k.a. SPAX and ABC types).

### 6.3 Recess Mounting Installation Diagram (Example of 2 over 2)

 Cut sheets for all models are available on our web site www.maxant.com or contact us directly.

### 7.0 Operation of the TECHLINE Illuminators

### 7.1 Turning on the Lamps

TECHLINE illuminators are designed to provide a single switching area at the bottom center of all view box configurations. We call this "cluster switching". TECHLINE illuminators can be operated using several switching methods. The following illustration provides examples of switch locations and operation of a two-panel over two-panel configuration. Optional dual intensity switches may not be clustered.

### 7.1.1 Standard Switching

Standard switching provides a two-position "ON/OFF" rocker switch per panel. UL187/CSA114 products use a single pole/single throw switch.

### 7.1.2 Film Activated Switching

The film activated switch option utilizes a three-position rocker switch per panel. When the rocker switch is in the "AUTO" position, inserting film into the roller grip activates the lamps. Remove the film to turn off the lamps. The "ON" and "OFF" positions are absolute. The "ON" position will turn on the lamps and they will stay on until the switch is changed to the "OFF" position.

### 7.1.3 Master Switch

The master switch option provides a two-position "ON/OFF" rocker switch that controls the power to the entire fixture. A master switch is required for UL60601-1 certified fixtures. The master switch has two poles and disconnects both sides of the line from the main.

### 7.1.4 Dual Intensity Switching

The dual intensity option provides a twoposition rocker switch that controls two levels of illumination (High/Low). There is one switch per panel so each panel may be controlled independently. Film activated switching is standard with the dual intensity option (see 7.1.2).

### 8.0 Internal Access and Maintenance

The unique design of the TECHLINE illuminator series allows for easy internal access for lamp replacement, ballast replacement and fixture maintenance.

## WARNING - ALWAYS DISCONNECT THE POWER TO THE FIXTURE BEFORE ATTEMPING TO ACCESS THE UNIT INTERNALLY. DO NOT TOUCH THE LAMP SOCKET AND THE PATIENT AT THE SAME TIME.

### 8.1 Replacing Lamps

Carefully observe the Plexiglas diffusing panel. Note that the panel rests in the back groove of the bottom film ledge and its top fits into the film grip. To remove this panel, grasp the panel near the bottom on both sides and lift it up until it is above the lower film ledge. Then pull out the bottom of the Plexiglas until it clears the film ledge and move it down until it is clear of the film grip on top. TO AVOID SCRATCHING THE PLEXIGLAS OR DAMAGING THE FILM SWITCH, AVOID SLIDING THE PLEXIGLAS OUT SIDEWAYS. Carefully set the Plexiglas on one end and lean it against the wall.

Be sure to remove any extra shipping tape. The lamps are removed by simply pulling them towards you without any rotation. Replace the lamp by firmly pushing it forward until the lamp is seated in the socket. It is a good idea to replace all lamps even if only one has burned out to insure even illumination.

To replace the Plexiglas diffusing panel, align it with the sides of the housing and slide it up into the film grip. Then push the bottom of the Plexiglas into the film grip until it fits comfortably.

### 8.2 Replacing the Ballast

Disconnect your illuminator(s) from power. First, remove both the Plexiglas diffusing panel (as described in 8.1.) Remove the two screws found inside of the lamp housing to free the wire-way cover and remove the cover. Next, remove the hex nut securing the ballast to the fixture. Check your replacement ballast. It should have the same color wires as the ballast that is in the fixture. If it does not, you may have the wrong ballast. If the wire colors match,
cut the wires connecting the defective ballast to the illuminator, leave as much length as possible. Remove the defective ballast.

Insert the new ballast into position and secure it with the hex nut. Strip the wires you have cut. Attach each stripped wire to its corresponding color entrance on the new ballast. Tug on the connectors. The wires should stay firmly attached. Replace the wire-way cover and Plexiglas panel as described in 8.1. Connect the unit back to power turn it on.

### 8.3 Replacing Fuses (UL/EN 60601-1 only)

Disconnect the unit from the power source. Remove the Plexiglas defusing panel. Remove the two screws that hold the wire-way cover that contains the master switch (Usually the right most panel). Observe the two fuses mounted side by side. Test the fuses for conductivity and remove the fuse that is defective. Replace the fuse with the specified size and type. Replace the wire-way cover and the two screws. Replace the Plexiglas panel as describer in 8.1. Connect the unit back to power and turn it on. IF THE FUSE BLOWS AGAIN, STOP AND DETERMINE WHAT THE CAUSE MAY BE BEFORE INSERTING ANOTHER FUSE.

### 8.4 General Maintenance

Routine maintenance on all illuminators is necessary for clean, unobstructed viewing equipment. The illuminator's interior and exterior surfaces and diffusing panels should be periodically wiped down with a soft cloth and a mild cleansing agent. Do not use ammonia or abrasive cleaners because they will scratch and fade surfaces. In the event the painted surfaces become scratched, please contact your local MAXANT dealer for touch-up paint.

### 9.0 Trouble Shooting Guide

## Note: Only trained and qualified personnel should gain access to the internal components to trouble shoot the equipment.

| SYMPTOM | POSSIBLE CAUSE | CORRECTIVE ACTION |
| :---: | :---: | :---: |
| No light in the entire fixture. | Blown fuse or open circuit breaker at the fuse box. CAUTION - THIS MAY BE AN INDICATION OF EITHER CIRCUIT OVERLOAD OR THAT A PROBLEM EXISTS ON THE CIRCUIT | Replace fuse or reset circuit breaker. Check for 117V 60 Hz at receptacle. |
|  | Faulty power cord or plug | Gain access to the ballast compartment and verify connections between the line cord and the fixture. |
|  |  | Check power cord or plug. If defective, replace or repair. |
| One panel will no light up. | All fluorescent lamps are burned out or broken | Replace fluorescent lamps. |
|  | Faulty power switch for that panel | Check for 117 V at output side of the "ON/OFF" or "ON/OFF/AUTO" switch when in the "ON" position. If there is no voltage, replace the switch. |
|  | Defective Film Activated MicroSwitch for that panel | With the power off, check that the switch is functioning. When the lever is depressed the contacts should short together. |
|  |  | Verify that the micro-switch lever will activate the switch as it may be damaged or bent. The lever may be adjusted so that the switch is activated just before the lever hits the top of the film grip. |
|  | Defective Ballast | Check for voltage (117V) on the ballast. If voltage is present and the lights still do not light, replace the ballast. If voltage is not found, repeat troubleshooting steps above. |
| One panel will not turn off. | Obstruction effecting the Film Activated Micro Switch | Check to make sure that the Plexiglas diffuser panel is all the way down in its groove. Check the film switch lever arm. If it is bent down too far, the plexiglas will cause it to turn on. Bend it back up. |
|  |  | Check to make sure that the Film switch lever is not jammed against the top of the film grip. |
| Some of the lamps in one section fail to light. <br> Some or all sections are slow to start or the lamps flicker when the fixture is on. | Lamp burned out or loose connection between the ballast and the lamp holder | Replace burned out lamps. Replace all lamps at the same time in order to maintain even illumination. Check connections to lamp holders. |
|  | Poor or missing ground connection | Determine that a proper ground is coming into the fixture as well as the power receptacle. Verify that the ground prong on the plug is connected in the outlet. |
|  | Air temperature in the room is below $50^{\circ} \mathrm{F}$ or air temperature blowing on the fixture is below $50^{\circ} \mathrm{F}$ | Increase the air temperature. Move illuminator away from air vents. |
| Individual lamps are slow to start in one section of the fixture. | Lamp is old and malfunctioning | Replace all lamps to maintain even illumination. Verify connections to the lamp holders. |
| Some sections are darker than others in the fixture. | Mixture of old and new lamps | Replace all lamps to even out the illumination. |
|  | Mixture of cool white and daylight type lamps | Use only daylight type lamps in illuminators. |

## 10. Replacement Parts List and Drawing

### 10.1 Expanded Drawing

### 10.2 Parts List

| Part Name | Part Description | Part Type | MAXANT Item No. |
| :---: | :---: | :---: | :---: |
| Master Switch | Two position "ON/OFF' rocker switch | One style per fixture | 1117 |
| Film Activated MicroSwitch | "AUTO" micro-switch activates lamps when the film is inserted into the top film grip. | Micro-switch only | 1307 |
| "ON/OFF/AUTO" three position rocker switch | Three position SPDT switch with film activated switch option | One style per fixture | 1121 |
| "ON/OFF" two position rocker switch | Standard SPST "ON/OFF' rocker switch | One style per fixture | 1122 |
| High/Low intensity two position rocker switch | Allows for two levels of brightness. | One style per fixture | 1116 |
| Ballast 117V 60Hz | TECHLINE 200Series | Two Lamp | 1039 U |
|  | TECHLINE 300 Series | Three Lamp | 1045U |
|  | TECHLINE 300 Series dual intensity | Three Lamp | 1027R |
|  | TECHLINE 400 Series | Four Lamp | 1060U |
|  | TECHLINE 400 Series dual intensity | Four Lamp | 1061 |
| Ballast 230V 50 Hz | TECHLINE 200Series | Two Lamp | 1062 |
|  | TECHLINE 300 Series | Three Lamp | 1063 |
|  | TECHLINE 300 Series dual intensity | Three Lamp | 1064 |
|  | TECHLINE 400 Series | Four Lamp | 1065 |
|  | TECHLINE 400 Series dual intensity | Four Lamp | 1066 |
| Roller Gravity Grip | Film holding system | One per panel | 1292 |
| Bottom Extrusion | Bottom plexiglas holder | One per panel | 1270A |
| Plexiglas | Diffusing Panel | 1 Panel Section | 1601 |
|  |  | 2 Panel Section | 1602 |
|  |  | 3 Panel Section | 1603 |
|  |  | 4 Panel Section | 1604 |
|  |  | 5 Panel Section | 1605 |
|  |  | 6 Panel Section | 1606 |
| Line cord assembly | Standard line cord | One style per fixture | 1125 |
| Line cord assembly | Hospital Grade (UL60601-1) | One style per fixture | 1308 |
| Lamp holders | Sockets for lamps | One style per fixture | 1279 |
| Fuse | 1 amp | Two per fixture | 1011 |
| Fuse | 2 amp | Two per fixture | 1012 |
| Fuse | 3.15 amp | Two per Fixture | 1015 |
| Fuse | 4.0 amp | Two per Fixture | 1014 |
| Fuse | 6.3 amp | Two per Fixture | 1016 |
